

# ECE 4320: Unit Commitment

Daniel K. Molzahn, Samuel Talkington

March 12, 2025

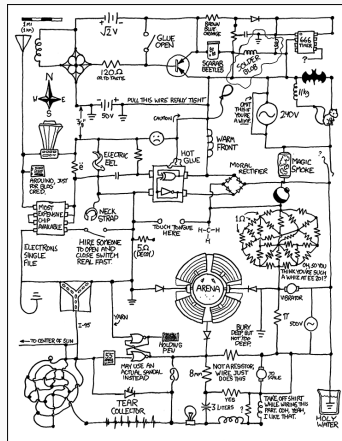

# Logistics

## Agenda: next 2 weeks

- Unit commitment ✓
- State estimation (x2)

## Office hours w/ me

- Project, coding, support
- Research interest chats

Source: xkcd

# Recap

## Last time:

- We introduced optimal power flow—make sure to check Prof. Molzahn's notes!
- We produced an *approximation* of this problem, **DC optimal power flow**.

## Today:

- We'll extend DC optimal power flow to handle new practical challenges.
- This extension is called the **DC *unit commitment* problem**.

### “Day-ahead” scheduling

- In DCOPF, we found generations  $p_g$  for a **single snapshot in time**.
  - What are some potential challenges with this?
  - Large generators can take time (hours) to start up and shut down.
  - In practice, we need to schedule their generation “day-ahead”.

# The key ideas behind unit commitment: Questions

Unit commitment combines two key ideas:

- **Key idea #1:** We allow the loads to **be time varying** over time periods  $t = 1, \dots, T$ :

$$\underline{p_d^1, \dots, p_d^t, \dots, p_d^T}.$$

- Q: How do we handle this?
- **Key idea #2:** We need to allow generators to be able to **turn off and on**.
  - Q: How do we handle this?

# The key ideas behind unit commitment: **Answers**

Unit commitment combines two key ideas:

- **Key idea #1:** We allow the loads to **be time varying** over time periods  $t = 1, \dots, T$ :

$$p_d^1, \dots, p_d^t, \dots, p_d^T.$$

- Q: How do we handle this?
- A: We need to find generator setpoints over these time periods:

$$\underline{p_g^1, \dots, p_g^t, \dots, p_g^T}.$$

- **Key idea #2:** We need to allow generators to be able to **turn off and on**.
  - Q: How do we handle this?
  - A: Introduce a new **binary variable** for each generator, at each time period:

$$u_i^t = \begin{cases} 1 & \text{if generator } i \text{ is } \text{on} \text{ at time } t \\ 0 & \text{if generator } i \text{ is } \text{off} \text{ at time } t. \end{cases}$$

## Recall: DC optimal power flow approximation

### DC optimal power flow approximation

$$\min_{\theta, p_g} \sum_{i=1}^n c_i(p_{gi})$$

net costs of  
all generation

$$\text{s.t.} \quad p_{gi} - p_{di} = \sum_{k=1}^n B_{ik}(\theta_i - \theta_k)$$

Linear approx  
(DC power  
flow)

$$p_{gi}^{\min} \leq p_{gi} \leq p_{gi}^{\max}$$

generation limits

$$-P_{ik}^{\max} \leq B_{ik}(\theta_i - \theta_k) \leq P_{ik}^{\max}$$

flow limits

# Extending DCOPF Unit Commitment

We need to **modify and add constraints** to our DC OPF problem to handle these two key ideas!

## Constraints we modify

Let's start transforming the DC OPF constraints, using our **binary variables**  $u_i^t \in \{0,1\}$ :

### Example: transform generator limits

$$p_{gi}^{\min} \leq p_{gi} \leq p_{gi}^{\max} \quad (*)$$

?

$u_i^t = 1 \Rightarrow$  generator  $i$  "can be" on  
 $u_i^t = 0 \Rightarrow$  generator  $i$  "must be" off

$$u_i^t p_{gi}^{\min} \leq p_{gi} \leq u_i^t p_{gi}^{\max}$$

## Constraints we add

gen.  $p_{gi}^{(t)}$  can't change too much from  $t-1$

We also need to add **totally new** constraints:

1: Ramp rates

2: Minimum up time

3: Minimum down time

4: On/off status

$$|p_{gi}^{(t)} - p_{gi}^{(t-1)}| \leq R_i + M \cdot \underbrace{\left( (1 - u_i^t) + (1 - u_i^{t-1}) \right)}_{\text{big-M}}$$

Constraint disabled if  
gen turned on/off

$$u_i^{t+K} \geq u_i^t - u_i^{t-1}, \quad K=1, \dots, \min(T-t, U_i)$$

minimum  
uptime

$$u_i^{t+K} \leq 1 + u_i^t - u_i^{t-1}, \quad K=1, \dots, \min(T-t, D_i)$$

min  
downtime

$$u_i^t \in \{0, 1\}$$

## Putting it all together: DC Unit Commitment (DCUC)

$$\min \sum_{t=1}^T \sum_{i=1}^n C_i(P_{gi}^{(t)}) + C_i^0 u_i^t$$

(gen. limits)  $u_i^t P_{gi}^{\min} \leq P_{gi}^t \leq u_i^t P_{gi}^{\max}$

(Power bal.)  $\overset{\text{vector}}{\mathbf{P}}_g^t - \mathbf{P}_d^t = \mathbf{B} \theta^t$

(Line flow limits)  $-P_{i,k}^{\max} \leq P_{i,k}^t \leq P_{i,k}^{\max}$

(other new constraints)

# Generalizations and extensions

Other possible additions to DCUC you may see in practice:

- Start-up costs
- Shut-down costs
- Reserve requirements
- Startup/shutdown/production rates

certain amount of excess generation

## Wait a minute, something seems fishy...

For each generator  $i = 1, \dots, n$  and each time period  $t = 1, \dots, T$ , we have two possible choices:

$$u_i^t \in \{0, 1\}.$$

- **Example:** Suppose we want to schedule  $n = 11$  generators over  $T = 24$  hours.
- **How many combinations of the  $u_i^t$ 's are possible?**

$$2^{nT}$$

*The estimated number of atoms in the known universe*

100,000,000,000,000,000,000,000,000,  
000,000,000,000,000,000,000,000,000,  
000,000,000,000,000,000,000,000,000

Hint: it's about that much ↑

# Aside: Mixed-Integer Linear Programming

- DCUC is a *mixed-integer linear program (MILP)*.
- There has been a **ton of progress** in solving these problems in recent years!

## MILP

### Performance Evolution

In Gurobi's MILP benchmark suite, the latest version delivers:

- A **91x** speed-up over version 1.1 in geometric mean (PAR-10) of runtimes
- Only **197** models remain **unsolved** after 10,000 seconds with the latest version. The test set consists of all models that can be solved by at least one version.

Gurobi Version Comparison: Speed and Solvability (PAR-10)

Gurobi MILP Benchmark Suite

Time limit: 10000 sec.  
Intel Xeon CPU E5-1240 v5 @ 3.50GHz  
4 cores, 8 hyper-threads  
32 GB RAM

Test set has 8273 models:  
- 788 discarded due to inconsistent answers  
- 2286 discarded that none of the versions can solve  
- speed-up measured on >100s bracket: 3076 models

# The future: Mixed-Integer **Non-linear** Programming

- These days, we're making progress on mixed-integer **non-linear** programming, too!
- These speed-ups are **more** than just faster computers.
- Could *you* make the next breakthrough?

Gurobi Version Comparison: Speed and Solvability (PAR-10)  
Gurobi Nonconvex MIQCP Benchmark Suite

## Nonconvex MIQCP

### Performance Evolution

In Gurobi's nonconvex MIQCP benchmark suite, the latest version delivers:

- A **96x** speed-up over version 9.0 in geometric mean (PAR-10) of runtimes
- Only **33** models remain **unsolved** after 10,000 seconds with the latest version. The test set consists of all models that can be solved by at least one version.

Time limit: 10000 sec.  
Intel Xeon CPU E3-1240 v5 @ 3.50GHz  
4 cores, 8 hyper-threads  
32 GB RAM

Test set has 1064 models:  
- 51 discarded due to inconsistent answers  
- 332 discarded that none of the versions can solve  
- speed-up measured on >100s bracket: 286 models

## How to solve: Branch-and-bound

MILP DC Unit  
Commitment

“Relax” the binaries:

$$u_i^t \in \{0,1\} \rightarrow u_i^t \in [0,1],$$

into continuous variables.

Branch-and-bound tree:

$$(p_g^*[k], \theta^*[k], u^*[k])$$

for all  $i, t$   
check  
 $u_i^t = 0$   
or  
 $u_i^t = 1$

if all  
binary,  
done.

## When we're done: Branch-and-bound

“Relax” the binaries:

$$u_i^t \in \{0,1\} \rightarrow u_i^t \in [0,1],$$

into continuous variables.

### Termination conditions and optimality:

Solution to the relaxed problem  
@ each node lower bounds the  
true optimal solution

Meaning, @ node  $k$

$$\sum_{t=1}^T \sum_{i=1}^n c(p_{gi}^t) + c_i^0 u_i^t$$

$$= f(p_{gi}^t, u_i^t) \leq f(p_{gi}^{t*}, u_i^{t*})$$

# Thanks

Thank you so much for attending!

- Please consider giving me feedback on this brief survey!
- I would truly value your input on my teaching so I can better serve you.
